Glass text Gimp plugin Properties

Description: Do not confuse this plugin with glass over text; another plugin of mine that ships with GEGL Effects. This plugin transforms plain text into glass text and it has a special hard light slider that allows you to fuse it with the hard light blend mode in Gimp to make even better glass text.

GEGL Operation name (lb:glasstext)

size: *This is in reverse; as in lower values make the glass text size larger and higher values make the glass text size smaller.*

glass(1,2,3): *A small portion of alien map's red, green and blue channel solarization option.*

hardlightmode: *This mode makes a better 'glass text' effect, but requires the user to use Gimp only blend modes 'hard light or linear light' with a image layer below it. To use this mode correctly set the slider to 0, put a another image file on a Gimp layer below and blend the text with hard light. If the image is overtly bright this will not work. This slider can also be used to give the glass some opacity.*
